

RDS

EC2 → (chef) →

Aurora & RDS (database)

System manager = terminal

Secrets manager = [many] yes

pass, work, stress
collateral point

CA.M6

challenge lab:- Migrating a database to Amazon RDS

Search EC2 → go to instance → an instance chef is already present → click on it.

copy it's ip on web like 1144.211.165.185/chef/ int.

we will get the [chef-dynamic-page]

Search

Aurora and RDS → create database. → standard create.

① MySQL

x ① Dev test

① Free tier

Availability & Durability

① Single-AZ DB

DB instance identifier

name = chefdb

Credential settings:-

Master username

admin,

credentials management.

① self managed

master password

msis @ 123

con jir pass.

msis @ 123

① Storage class

db.t4g.micro

Storage
gp2

→ 20

→ vpc

iceb vpc

VPC security firewall
① choose existing.

VPC security group.
- dbsec (remain default)

uncheck the enhanced monitoring → Create database

~~Duplicate db~~

click on database - 1, just you have created

Security

VPC security groups.

click link (dbsec - ...)

click on security group id

↓

Edit inbound rules → Add rule → MYSQL/AURORA → CF from

↓

security group

→ go to instances (caption)
 ↓ already created

cafe-sg

connect
↓
on top

→ go to ~~session~~ ^{session} manager. → you go to terminal,

↓ then you reach ~~system~~ ^{system} manager.

→ sudo su

→ ~~sudo~~ su ec2-user → cd →

[ec2-user@cafeuser bin]\$ → mysql dump --database cafe-db -u
root -p > cafe.sql

password (msis1234)

→ mysql -h (url point of database - 1) -u admin -p
database - 1, create table

~~password~~ Be fast a → you will get in

= left to

~~create~~ create database cape-db;
source cape.sql;

changed to same
name in
systems manager
(no need to
change
cape-db)
// cape / draw = cape-db

go to ~~database~~ secrets manager
change username, password & URL in secrets manager.
admin ms151734
→ endpoint in database

sudo systemctl stop mariadb.service
sudo systemctl restart httpd

(again the page
will work)
